

Mark scheme – Nature of Quantities

Question	Answer/Indicative content	Marks	Guidance
1	A	1	
	Total	1	
2	B	1	
	Total	1	
3	a	M1 A1	Arrow vertical down <u>and</u> an arrow opposite to the frictional force. Both arrows labelled correctly. Allow weight / mg / W for the downward arrow <u>and</u> tension / T / 'force in rod' / 'force in tow bar' / 'driving force' for the 'upward' arrow
	b	C1 A0	$(W_s =) 1100 \times 9.81 \times \sin 10^\circ$ or $1100 \times 9.81 \times \cos 80^\circ$ $(W_s = 1874 \text{ N or } 1900 \text{ N})$ Allow g instead of value
	c	A1	force = $1900 + 300$ force = 2200 (N) Allow $1870 + 300 = 2170 \text{ (N)}$
	d	C1 C1 A1	(distance =) $120 / \sin 10^\circ$ or 691 (m) (work done =) 2200×691 work done = $1.5 \times 10^6 \text{ (J)}$ Allow ECF from (c) Allow ECF from an incorrect attempt at first mark.
	e	C1 C1 A1	$(A =) \pi \times \frac{2200}{0.006^2}$ or $1.1 \times 10^{-4} \text{ (m}^2\text{)}$ (stress =) $\frac{2200}{\pi \times 0.006} \text{ an d } 2.0 \times 10^{11} = \frac{\text{stre}}{\text{stra}}$ $x = 4.8 \times 10^{-5} \text{ (m)}$ Allow ECF from (c) Allow $x (=FL/EA) = \frac{2174 \times 0.5}{2.0 \times 10^{11} \times 1.1 \times 10^{-4}}$ Allow 2 marks for 1.2×10^{-5}; $1.2 \times 10^{-2} \text{ m}$ used as radius Allow answer between 4.7 and $5.1 \times 10^{-5} \text{ (m)}$
	Total	10	
4	A quantity that has both direction and magnitude. Correct example given, e.g. velocity.	B1	Note: The B1 mark is for a correct statement and a correct example.

2.3 Nature of Quantities

			Total	1	
5			B	1	Examiner's Comments The question requires knowledge and understanding of the forces acting on the ball in flight and resultant force. The path of the ball is shown. At X, the ball is travelling in the direction shown by the D arrow. The drag force will be in the opposite direction. Weight is other force acting on the ball – vertically downwards. Vectorially adding the weight and the small drag will produce a resultant in the direction shown by the B arrow. The answer (key) is therefore is B. The most popular distractors were A and D. Exemplar 1 The right-hand side of the exemplar has the jottings of a candidate and it does help to visualise the problem. This would certainly not qualify as an acceptable answer in Section B, but here, it demonstrates excellent technique; a vertical line for the <i>weight</i> and a slanting line for the <i>drag</i> and both being added to give the dotted line for the <i>resultant force</i>. This matches the arrow B.
			Total	1	
6			C	1	Examiner's Comments All of the questions showed a positive discrimination, and the less able candidates could access the easier questions. The questions in Section A do require careful reading and scrutiny. Candidates are advised to reflect carefully before recording their response in the box. Candidates must endeavour to use a variety of quick techniques when answering multiple choice questions. The correct key was C and the most popular distractor was A. The kinetic energy of the ball at the ground was K. At maximum height, the ball just has horizontal component of velocity. The kinetic energy of the ball is proportional to speed^2. At the maximum height the kinetic energy must therefore be $\cos^2 30^\circ K = 0.75 K$.

2 0	a		$2 \times T^2 = 4.8^2$ or $2T \sin 45^\circ = 4.8$ or $T = 4.8 \sin 45^\circ$ $T = 3.39(4)(N)$	B1 B1	Note: $\sin 45^\circ = \cos 45^\circ$ Note: T must be given to at least 3 SF

Examiner's Comments

This question was good discriminator, where the top-end candidates could demonstrate their powers of analysis. The success in (c) was very much dependent on a well-annotated triangle of forces in (b). Most triangle of forces were workable but lacked detail. Missing labels and incorrect direction of the force arrows were the main misdemeanours. As expected, candidates used a range of methods to show the force in the extended spring was 3.4 N. In order of popularity, the techniques were using Pythagoras' theorem, using trigonometry, resolving forces in the vertical direction and sine (or cosine) rule. It is sensible to show the final answer to more significant figures than required in a 'show' question.

Exemplar 6

- (b) Sketch a **labelled** triangle of forces diagram for the three forces acting at point X. You do not need to draw this diagram to scale.

- (c) Show that the tension T in each extended spring is 3.4 N.

$$T^2 + T^2 = 4.8^2 \quad \checkmark$$

$$2T^2 = 23.04$$

$$T^2 = 11.52$$

$$T = 3.39 \text{ N} \quad \checkmark$$

$$\approx 3.4 \text{ N}$$

$$\rightarrow 3.4 \text{ N}$$

This exemplar illustrates a flawless answer from a top-end candidate.

The triangle of forces of perfect – all labels clear and the pivotal angle 90° between the two tensions marked. The calculation in (c) makes an excellent use of this triangle to show that the force is 3.39 N and hence 3.4 N.

Contrast the above excellent solution with the exemplar shown below from a grade C candidate.

Exemplar 7

2.3 Nature of Quantities

				(b) Sketch a labelled triangle of forces diagram for the three forces acting at point X. You do not need to draw this diagram to scale.  (c) Show that the tension T in each extended spring is 3.4 N. $4.8 \sin(45) = 3.39 \text{ N}$ $\approx 3.4 \text{ N}$ The triangle of forces in (b) is simply not right. However, in (c), the analysis is correct and shows another plausible method for securing the 2 marks. Again, it is good to see the penultimate value for the force given to more than two significant figures.
	b	$3.4 = 24x$ or $(x =) \frac{3.4}{24}$ or $(x =) 0.14(17)(\text{m})$ $(E = \frac{1}{2} \times 24 \times 0.1417^2$ or $E = \frac{1}{2} \times 3.4 \times 0.1417)$ energy = 0.24 (J)	C1 A1	Allow the C1 mark for $E = 3.4^2/(2 \times 24)$ Allow 3.39(4) N No ECF from (c)
		Total	4	
2 1	a	i	C1	
		i	C1	or use $v^2 = u^2 - 2gs$ or $s = (u + v)t/2$
		i	A1	note: if $g = 10$ is used, then maximum score is 2/3
		ii	C1	ecf 2a
		ii	A1	allow 25.5 m
	b	$0 = 17 \sin 30 t - \frac{1}{2} \times 9.81 \times t^2$ so $t = 0$ or $17/9.81 = 1.73$ $s = 14.7 \times 1.73 = 25.4$ (m)	C1 C1 A1	allow $s = 15 \times 1.7 = 25.5$ (accept 25 or 26 to 2 sf)

2.3 Nature of Quantities

	c	the ball has the same speed (of 17 m s^{-1}) but is at different (either at 60° or 30°) angle to the horizontal.	B1	
		larger horizontal velocity (second trajectory) so travels further or higher bounce (first trajectory) so less drag from grass so travels further.	B1	accept any sensible answer, e.g. steeper bounce loses more energy in impact so slows more.
	d	horizontal component = $17 \sin 30$ or $17 \cos 60 = 8.5 \text{ (m s}^{-1}\text{)}$	B1	
		at highest point vertical component of velocity is zero.	B1	
		Total	12	
2 2		(The resultant of the tensions in the springs is) $W / 4.8 \text{ (N)}$	B1	
		Direction: up(wards) / opposite to weight / opposite to W (because the total force in the vertical direction is zero)	B1	
		Total	2	
2 3		Mass is a scalar (quantity) and velocity is a vector (quantity).	B1	
		(Addition of) velocity depends on direction / sign / vector triangle / resolving (ORA)	B1	Allow 'Velocity can be cancelled out' Examiner's Comments Candidates answered this opening question extremely well, with the majority gaining two marks. A variety of answers were accepted. Most candidates knew that the direction of velocities had to be considered when adding vectors. Candidates who identified mass as a scalar and velocity as a vector and then defined these two quantities were awarded full marks.
		Total	2	
2 4	i	$(v^2 = u^2 + 2as)$		Allow other methods
		$2.5^2 = 1.3^2 + 2 \times 1.10 \times (\text{Any subject})$	C1	Allow this mark for $t = 0.58 \text{ (s)}$
		$a = 2.1 \text{ (m s}^{-2}\text{)}$	A1	Note answer to 3 SF is $2.07 \text{ (m s}^{-2}\text{)}$ Examiner's Comments Most candidates demonstrated excellent understanding and application of equations of motion. The solutions were often well represented, calculations done correctly and the answer written to the correct number of significant figures (SF). A variety of routes were possible, but the most popular method was using the equation $v^2 = u^2 + 2as$.

2.3 Nature of Quantities

				Exemplar 5 (i) Calculate the acceleration a of the trolley. $s = 1.1$ $u = 1.3$ $v = 2.5$ $a = ?$ $t = ?$ $v^2 = u^2 + 2as$ $a = \frac{v^2 - u^2}{2s}$ $\frac{2.5^2 - 1.3^2}{2 \times 1.1} = 2.1 \text{ ms}^{-2}$ $a = 2.1 \text{ ms}^{-2}$ This exemplar from a grade E candidate shows flawless technique. The known and unknown quantities are written on the left-hand side. The equation is clear, as is the substitution and the final answer for the acceleration.
		ii	$ma = mg \sin \theta$ or $a = g \sin \theta$ or $2.07 = 9.81 \times \sin \theta$ $\theta = 12^\circ$	C1 Allow $2.1 \text{ (m s}^{-1}\text{)}$ Allow $g = 9.8$ Note using $\tan^{-1}(2.07/9.81)$ is wrong physics. Possible ECF from (b)(i) Allow $g = 10$ here; it gives the same answer to 2 SF Allow 1 mark for 78°
		Total	2	
2 5		$T = 60/\sin 30$ or $60/\cos 60$ $T = 120 \text{ (N)}$	C1 A1	
		Total	2	
2 6	a	i	weight; (tractive) force up slope; drag; (normal) reaction	
		i		B1
		i	All forces in correct direction and correctly labelled.	
	ii	ii	$14.4 + (85 \times 9.81 \times \sin \theta) = 41.7$ $\theta = 1.9^\circ$	C1 ecf from (a)(ii) A1
	b		any three from: - drag reduces velocity or increases time to cross or some kinetic energy of cyclist goes to heat. - longer crossing time results in cyclist at lower point on other side of gap. - moment on bicycle	B1 $\times$ 3 Allow argument based on: - very short crossing time ($< 0.43\text{s}$ at speed of 6 ms^{-1} up slope). - energy changed to heat insignificant compared to KE - amount of rotation very small in short time.

2.3 Nature of Quantities

			rotation lowers height of front wheel.		
			Conclusion based on argument(s). The maximum gap width is smaller.	B1	conclusion based on argument(s). So no change in maximum gap width.
			Total	7	
2 7			resultant force = $(7.0^2 + 5.0^2 - 2 \times 7.0 \times 5.0 \times \cos 40) ^{1/2}$	C1	Allow: resultant force = $[(7.0 - 5.0 \times \cos 40)^2 + (5.0 \times \sin 40)^2]^{1/2}$
			resultant force = 4.51 (N)	C1	Allow full marks for a correct scale drawing to determine the resultant force; resultant force = 4.5 ± 0.1 N
			acceleration = $4.51 / 0.320 = 14$ (m s ⁻²)	A1	Allow full marks for resolving into horizontal and vertical components and combining correctly.
			Total	3	
2 8	i		Straight line drawn from the bottom of the 9.0 m s ⁻¹ vector to the end of the 4.2 m s ⁻¹ vector	B1	Ignore incorrect / omitted direction of resultant vector Ignore any other additional lines drawn
	ii		$v^2 = 9.0^2 + 4.2^2 - 2 \times 9.0 \times 4.2 \times \cos 50^\circ$ $v = 7.1$ (m s ⁻¹) OR length of resultant vector line measured and some calculations $v = 7.1$ (m s ⁻¹)	C1 A1 C1 A1	Allow other correct variants of this method Note answer to 3 SF is 7.07 Allow length of resultant vector in the range 5.4 – 5.6 cm Allow ± 0.20 (m s ⁻¹)
			Total	3	
2 9			$W (= mg) = 8.0 \times 9.81$ $F = (W \sin 30 = 78.5 \times 0.5 =) 39$ (N) $R = (W \cos 30 = 78.5 \times 0.87) = 68$ (N)	C1 A1 x 2	$= 78(.5)$ (N) not 80 (N) Allow 8g Allow 1/2 for F and R the wrong way round  Credit full marks for use of a scale drawing which gives answers correct to ± 2 N Special case: Allow 2/3 for use of $W = 80$ (N) giving $F = 40$ (N) and $R = 69$ (N)

2.3 Nature of Quantities

					<u>Examiner's Comments</u> Most candidates were able to answer this question easily, although a few got their answers for F and R the wrong way around.
			Total	3	
3		i	speed = $\frac{2 \times \pi \times 0.60}{20}$	C1	
0		i	speed = 0.19 (m s ⁻¹)	A1	
		ii	Displacement is the direct distance of the locomotive from A , so the graph is symmetrical about $t = 10$ s.	B1	
		ii	At $t = 20$ s it returns back to A or at $t = 10$ s it is 1.2 m from A or at $t = 10$ s, it is at C .	B1	
			Total	4	
3		i	Any <u>two</u> from: - Direction of g for Earth and Mars are in opposite directions - For small values of r / $r < \text{about } 4.4 (\times 10^{10} \text{ m})$ g for Earth is greater or resultant g is towards the Earth - At r about $4.4 (\times 10^{10} \text{ m})$ the g values are the same/AW - Inverse square law for g for either planet causes curve near to either planet's surface/AW - Zero point for (resultant) g is further from the Earth (than the midpoint) since Earth has a larger mass than Mars g at Earth's surface is larger than g at surface of Mars because Earth has a larger mass than Mars	B1x2	Allow field / (gravitational) force for g Allow for r values larger than $4.4 (\times 10^{10} \text{ m})$ g for Mars is greater or resultant g is towards Mars <u>Examiner's Comments</u> Most candidates mis-read the question and tried to describe the shape of the curve, rather than explain why the curve has that shape. Many candidates also mis-used the term 'exponential' to describe a curve that is related to $1/r^2$. Others thought that the graph showed the effect of Mars and the Earth on each other, rather than on a small mass between them. They went on to describe what happened when Mars and Earth were separated by an increasingly large distance. It is good practice to be specific about which section of the graph you are talking about. 'When r is below $2.0 \times 10^{10} \text{ m}$' is much clearer than 'At the start'. <i>Potential, potential difference, potential energy, field strength and force</i> These terms are all very similar yet subtly different and with differing formula. Be careful you know which is which.
		ii	Any valid equation relating g_{Earth} and g_{Mars} e.g. $GM_{\text{Earth}}/r_{\text{E}}^2 = GM_{\text{Mars}}/r_{\text{M}}^2$ ratio <u>consistent</u> with values above	C1 A1	

2.3 Nature of Quantities

				Note: the correct ratio is in the range 8.2 to 12 allowing for values of r of 4.4 ± 0.1 ($\times 10^{10}$ m) when $g = 0$ <u>Examiner's Comments</u> To correctly answer this question, the candidate should equate the gravitational field strength from Earth (GM_{Earth}/x^2 where x is the distance to the point where $g=0$ from the centre of Earth) and the gravitational field strength from Mars (GM_{Mars}/y^2 where y is the distance to the point where $g=0$ from the centre of Mars). Many candidates did not get this far, yet some that did substituted and re-arranged correctly get a value in the correct range. Errors occurred when candidates were unsure of which distances to use in the equation. The commonest error was to use 0.9×10^{10} m for the distance of the zero-point since the graph stops at 5.3×10^{10} m, rather than using the data provided that the distance between the centres of the two planets was 5.8×10^{10} m and so the correct value for r was 1.4×10^{10} m.
			Total	4
3 2		(weight of plank $\Rightarrow$) 50×9.81 or 490.5 OR uses a distance of 0.7m to calculate clockwise moment (anticlockwise moment $\Rightarrow$) $T \sin 30^\circ \times 1.5$ OR $0.75T$ (clockwise moment $\Rightarrow$) 490.5×0.7 = 343 (N m) $T \sin 30^\circ \times 1.5 = 343$ OR $T \sin 30^\circ = 229$ $T = 457.8$ (N)	C1 C1 C1 C1 A0	Allow $T \cos 60^\circ \times 1.5$ Allow 344, Allow 458.6, <u>Examiner's Comments</u> This question was a "show" type question where candidates needed to show that the tension in the cable was about 460 N. Ideally in these type of questions, candidates should have shown their working logically and gained answer of 457.8 (N). Most candidates scored a mark for determining the weight of the beam. Good candidates clearly showed their working. Good candidates stated the principle of moments, indicated how the clockwise moment would be determined, indicated how the anticlockwise moment would be determined and gave an answer of 457.8 (N). To determine the anticlockwise moment candidates needed to resolve the

2.3 Nature of Quantities

				tension T into its vertical component – both $T\sin 30^\circ$ and $T\cos 60^\circ$ were acceptable. Exemplar 3  $m = (50 \times 9.81) \times 0.7$ $= 343.35$ $m = F \times d$ $343.35 = 1.5 \times F$ $F = 228.9$ $\sin 30^\circ = \frac{x}{T}$ $0.5 = \frac{228.9}{T}$ $T = \frac{228.9}{\sin 30^\circ}$ $= 457.8 \text{ N} \approx 460 \text{ N}$ In this exemplar the candidate has clearly shown the working to answer the question. Initially the candidate has calculated the clockwise moment by multiplying the force (mass of 50 (kg) by 9.81) by 0.7 (m). This gains two marks. The candidate's answer could have been better if the candidate had written on the left-hand side "clockwise moment" rather than "m", however, it is implicit from the candidate's working the meaning of "m". The candidate has then clearly shown that the anticlockwise moment is equal to the clockwise moment and determined correctly the perpendicular force or vertical force. The candidate then correctly relates the force T to $\sin 30^\circ$ and the vertical force and evaluates the answer as 457.8 N before indicating that this is approximately 460 N. Including the 457.8 is appropriate in these type of show questions.
		Total	4	
3 3	i	$(t =) \frac{6.3}{9.8(1)}$	M1	Allow other correct methods, e.g: $(t) = \sqrt{\frac{2 \times 2.0}{9.8(1)}} \text{ or } (t) = \frac{2 \times 2.0}{6.3}$
	i	$(t =) 0.6(42 \dots \text{s})$	A0	Not $a = 10 \text{ m s}^{-2}$ Note t must be the unknown Examiner's Comments There were some convoluted answers. A number of candidates gained

2.3 Nature of Quantities

					credit but wasted time by solving a quadratic equation. Some candidates assumed that the vertical velocity was an average and determined the time and then just multiplied by two without explanation – this did not gain credit. Clear explanations of the method are used to answer these types of “show” questions.
		ii	$(v_H =) \frac{18}{0.64} \text{ or } \frac{18}{0.6}$	M1	Note v must be the unknown
		ii	$(v_H =) 28 \text{ (m s}^{-1}\text{) or } 30 \text{ (m s}^{-1}\text{)}$	A0	Examiner's Comments This part was answered better although some candidates tried using an equation with acceleration.
		ii i	$v = \sqrt{6.3^2 + 30^2}$	C1	$v = \sqrt{6.3^2 + 28^2}$ Allow trigonometry methods
		ii i	$v = 31 \text{ (m s}^{-1}\text{)}$	A1	$v = 29 \text{ (m s}^{-1}\text{)}$ Note 940 scores one mark Examiner's Comments A pleasing number of candidates determined the magnitude of the velocity correctly, Some correctly used trigonometry methods.
			Total	4	
3 4		i	Example (not to scale): 	B1 B1	horizontal arrow (judge by eye), in the direction shown arrow drawn at an angle of 60° to the horizontal (angle must be shown), in the direction shown
		ii	Example (not to scale):  (Can apply principle of) conservation of momentum (since no external forces are acting)	B1 B1	arrow drawn at an angle of 60° to the horizontal (angle must be shown), in the direction shown Examiner's Comments This was not an easy question but, even so, a good number of candidates did well. The marks were given for the direction (rather than for the magnitude) of the momentum vectors. Some of the common errors were: • forgetting to label relevant angles • not using arrows to show direction • drawing a vector triangle without any indication of which arrow was meant to be the final momentum.
			Total	4	

2.3 Nature of Quantities

3 5	i	4.4 – 4.6 (N)	B1	
	ii	Weight of cylinder 3.5 cm vertically (judge by eye) Correct closed triangle drawn including T_A Correct directions indicated for weight and T_A and $T_A = 6.4 \pm 0.2$ (N)	M1 M1 A1	
	ii i	$39 \pm 1^\circ$	A1	Allow ECF from (b)(ii) for trigonometry methods
		Total	5	
3 6	a	Correct pattern Correct direction of the field	B1 B1	Note: At least five field lines must be drawn and of these, two must be perpendicular (by eye) to the surface of the sphere and plate Note: This may be shown on just one line Examiner's Comment Most candidates drew decent field patterns and showed the correct direction of the electric field. It is difficult to draw curved field lines, but those who were careful and had the field lines perpendicular at both the surface of the sphere and the metal plate were rewarded.
	b	(Electric potential) is the <u>work</u> done per (unit) charge in bringing a <u>positive</u> charge from infinity (to the point).	B1	Allow: <u>work</u> done / <u>energy</u> required to bring a unit <u>positive</u> charge from infinity (to the point) Examiner's Comment This was not well-answered; the modal mark was zero. Definition for electric potential lacked precision and often made no reference to a 'unit positive charge' or 'per unit positive charge'. At times, other quantities such as electric field strength and gravitational field strength were being defined. This was a missed opportunity -definitions just need to be learnt.
	c i	$V = Q/4\pi\epsilon_0 r$ (Allow any subject) $Q = 4\pi \times 8.85 \times 10^{-12} \times 0.015 \times 5000$ $Q = 8.3(4) \times 10^{-9}$ (C)	C1 C1 A0	Note using $E = V/d$ with $E = Q/4\pi\epsilon_0 r^2$ is wrong physics and hence scores zero Note if the value of ϵ_0 is not given here, it could be implied in the correct 3sf answer Allow any subject here if the answer is given to more than 2sf Allow the use of $1/4\pi\epsilon_0 = 9 \times 10^9$ Examiner's Comment By contrast to the last question, the answers here were perfect. Correct values were substituted into the equation for electric potential to show that the charge was that stated in the question. In a 'show' question, always give the final answer to more significant figures than the required answer. It was good to see many scripts with the final answer written as 8.34×10^{-9} C.

2.3 Nature of Quantities

				Not $1.7 \times 10^{-2} \sin 4$ or $1.7 \times 10^{-2} \cos 86$ Allow $1.7 \times 10^{-2} \times \sin 4 / \cos 4$ M1 Allow 2 marks for 1.45×10^5 (N C⁻¹), 8.3×10^{-9} used Allow 2 marks for 1.43×10^5 (N C⁻¹), 1.19×10^{-3} (N) used (A0) Examiner's Comment C1 This was a good discriminator with high-scoring candidates either using triangle of forces, or resolution of forces, to determine the electric force on the sphere. The value of the force was given so that it could be used to answer the next question. A1 More than half of the candidates correctly calculated the electric field strength using the information provided in (c)(i) and (c)(ii)1. Some candidates used the elementary charge rather than the value from (c)(i) to calculate the field strength; this gave an incorrect answer of 7.5×10^{15} N C⁻¹.
		Total	8	
3 7	i	The direction of the electric field due to the negative charge is to the left and right for the positive charge.	B1	
	i	The magnitude of the electric field strength due to the positive charge is smaller than that for the negative charge (because of greater distance). (Hence the resultant electric field strength is to the left.)	B1	
	ii	energy = $\frac{Qq}{4\pi\epsilon_0 r} = \frac{(1.60 \times 10^{-19})^2}{4\pi\epsilon_0 \times 3.0 \times 10^{-10}}$	C1	
	ii	energy = $7.67(2) \times 10^{-19}$ (J)	C1	
	ii	energy = 4.8 (eV)	A1	
		Total	5	
3 8	i	$F = (mv^2/r =) 8.0 \times 1.5^2/2.0$ $F = 9.0$ (N)	C1 A1	Allow answer to 1s.f. Examiner's Comments Question 4(b)(ii) proved very difficult and highlighted poor understanding of circular motion. Almost all candidates described the centripetal force as an additional force that had appeared out of nowhere. This centripetal force 'pulled the suitcase inwards' (or, in some cases, outwards) or 'balanced the frictional force' or 'added to the frictional force' and so on.

				Exemplar 5 <i>At 4.4 the bag is moving in an arc, meaning that centripetal force is acting on it as well as weight, friction and the normal force. In order to keep the bag in equilibrium friction has to increase and R has to decrease so the centripetal force works against friction (F) and with R.</i> The candidate who gave the response in Exemplar 5 clearly thinks that an additional force, called the centripetal force, now acts on the suitcase. The forces F and R have to adjust in order to keep the suitcase in equilibrium. They have not realised that the suitcase is no longer in equilibrium horizontally but is accelerating. This means that the available forces have to adjust in order to provide a resultant force towards the centre of the circle, while still balancing vertically. Exemplar 6 <i>The suitcase is now accelerating towards the center of the semicircle. This means there is a net force acting to the left (on the diagram). W has no component to the left so F must increase so that there is a component to the left allowing it to accelerate allowing it to stay on course. The centripetal force required is 9N so the horizontal component of F must be 9N bigger than the horizontal component of R. The suitcase must not move down or up though so their vertical components must still add to 78.48N so F increases and R decreases.</i> In contrast, the candidate who wrote the response in Exemplar 6 has a much better grasp of the situation.  AfL Rather than using the phrase 'centripetal force', candidates could be encouraged to think of motion in a circle as a special case of $F = ma$ where the resultant force F points towards the centre of the circle and the acceleration a is given by v^2/r. This should hopefully encourage them to think about which of the forces available in the situation could provide the resultant force for this motion to occur.
	ii	- Suitcase accelerates / changes its velocity / (constantly) changes direction / has a resultant force acting on it / is no longer in equilibrium - The resultant force must act (horizontally) towards centre of circle / to the left - The centripetal force can only be provided by (an increase in) F	B1 x 4 A0	Any answer that mentions centrifugal force scores 0/4 Ignore any statement that treats the centripetal force as an extra force Allow net or unbalanced or total for resultant throughout or $F \cos 30^\circ - R \sin 30^\circ$ increases (from 0 to 9.0 (N)) / the (magnitude of the) horizontal component of F must exceed the (magnitude of the) horizontal component of R not a resultant force acts towards Y e.g. Friction is the only force able to provide the centripetal force / only F has a component to the left Allow F provides the centripetal force Not the horizontal force must increase / increases

2.3 Nature of Quantities

		Increased vertical component of F means the vertical component of R must decrease (in order to balance W) So R must decrease		or $F \sin 30^\circ + R \cos 30^\circ = W$ / W is the vector sum of F and R / $W = (F^2 + R^2)^{1/2}$ (and F increases while W remains constant) Total

The information is in the most part relevant.</i> 0 marks No response (NR) or no response worthy of credit (0).	B1 x 6	Indicative scientific points may include: Description - Ruler used to determine x - Average readings to determine x x recorded for various v - Suitable method for consistent v or varying v e.g. - Released from same point on a track - Ejected from a spring device with different compressions - Suitable method of determining point of impact e.g. - trial run to get eye in approximate correct position - carbon paper so that ball makes a mark on paper - scale in frame of video recording - tray of sand to catch ball - Suitable instrument used to determine v (light-gate / motion sensor / video techniques) or suitable description of inference of v from other measurements such as energy released from spring of known k and x - Ensuring the initial velocity of ball is horizontal Analysis - Horizontal velocity is constant - Time of fall is independent of v/horizontal velocity - Suggested relationship: e.g. $x \propto v$, x d.p. to V^2, etc - Plot a graph of x against v or graph consistent with candidate's suggested relationship - If relationship is correct, then a straight line through the origin. - Suggested relationship supported by correct physics or algebra. - Correct relationship supported by physics. Note: L1 is used to show 2 marks awarded and L1^ is used to show 1 mark

awarded.

Examiner's Comments

Many candidates had plenty to say that was sensible. There was plenty of evidence that candidates had seen this experiment or had performed a similar one themselves. A few confused the question, instead describing how to find the time of flight or that the ball was falling vertically. Others described what they thought would happen to the vertical component of velocity when they changed the vertical distance that the ball dropped.

Exemplar 2

Use your knowledge of projectile motion to suggest the relationship between v and x . Describe how an experiment can be safely conducted to test this relationship and how the data analysed.

As in a projectile the horizontal component of velocity is constant given air resistance is negligible then an equation of $x = \frac{1}{2}at^2$ could become $x = vt$ where x is distance travelled v is velocity of ball and t time of flight. Therefore for a constant time of flight it can be said $x \propto v$.
~~To test this it is very hard to keep time of flight constant as this is due to its time of freefall.~~
 To test this a ball would be rolled off a table at varying speeds. To calculate this speed a light gate can be used passing through the center of the metal ball. As distance travelled is equal to the diameter of the ball, measured by a ruler, speed can be calculated using distance/time from

2.3 Nature of Quantities

				light gate. For safety the ball should land in sand as not to shatter or land on someone's foot. This also makes measuring x much easier as x is equal to the horizontal distance from the edge of the table to the crater in sand measured using a ruler. If the ball takes to fall is kept constant measuring using a stop watch and control by raising or lowering the launch point when v is plotted against x on a graph it can be expected to be linear and pass through origin. In the first paragraph, the candidate has made clear that the time of flight is constant and goes on to explain why towards the end of the response. This supports the prediction that $v \propto x$. In addition, the candidate takes time to explain how to obtain data for both the horizontal velocity and horizontal distance. It was pleasing to see light gates and motion sensors being employed, with the best answers explaining how to use the data provided by the sensors to calculate the velocity of projection. The exemplar response also includes the correct analysis. There is a graph of v against x and the resulting best fit straight line through the origin supports the idea that these two variables are directly proportional. Too many candidates did not mention the crucial statement about the line going through the origin, limiting their response to a high L1 or low L2.

2.3 Nature of Quantities

		i v	(horizontal velocity =) $30.0 \cos 70^\circ$ or $10.2\dots$ (m s^{-1}) or $30.0 \sin 20^\circ$. $E_k = \frac{1}{2} \times 0.057 \times 10.26^2$ $E_k = 3.0(\text{J})$	C1 A1	Allow 1 SF answer Not 22 (J), $v = 28$ used Not 23 (J), $v = 28.2$ used Not 140 (J), $v = 70$ used <u>Examiner's Comments</u> Part (i) was particularly well answered by 95% of all candidates. Nine out of ten candidates scored full marks in part (a)(ii), as they remembered that the question asks to <i>show</i> that the maximum height is around 40m. Working for this type of question is essential. In part (a)(iii), three quarters of all candidates correctly talked about the ball still having a horizontal velocity (which wasn't zero) and therefore still possessing some KE. The key to this part (a)(iv), remembered by most candidates, was to use the horizontal component of velocity to find the KE at the maximum height. Some used the initial speed and others used the initial vertical velocity component found in part (a)(i).

4 2		i	$87.4 \cos 50^\circ$ or $68.0 \sin 10^\circ$ $F = 68.0$ (N)	C1 A1	Allow $87.4 \sin 40^\circ$ or $68.0 \cos 80^\circ$ Allow cosine and sine rules being used, e.g. $F^2 = 68.0^2 + 87.4^2 - 2 \times 68.0 \times 87.4 \times \cos 50^\circ$ or $F = 87.4 \times \sin 50^\circ / \sin 80^\circ$ or $F = 68.0 \times \sin 50^\circ / \sin 50^\circ$ Allow 2 SF answer here <u>Examiner's Comments</u> The question has a clue for making a start on this question. Most candidates did resolve the two tensions in the cables vertically. The majority of the responses were well-structured and demonstrated excellent understanding of vectors. Although not straightforward, many candidates used the correct angle when determining the vertical components of the forces. The correct answer of 68.0 N appeared on most scripts. A small number of candidates got 1 mark for just getting one of the components correct. A very small number of candidates got the correct answer by using trigonometry and triangle of forces. This is not what was expected, but full credit was given for this alternative approach. Correct responses will always score marks, even when the candidates choose not to go along the path designed by the examiners. This different approach is illustrated in the exemplar 6 below. Exemplar 6

2.3 Nature of Quantities

				Calculate the total vertical force F supplied by cables A and B by resolving the tensions in cables A and B.  $F^2 = A^2 + B^2 - 2AB \cos \theta$ $F = \sqrt{68^2 + 87.4^2 - 2 \times 68 \times 87.4 \times \cos 50}$ $= \sqrt{4622.329...}$ $= 67.98... \text{ N}$ $\approx 68.0 \text{ N (3sf)}$ $F = \dots\dots\dots 68.0 \text{ N [2]}$ The candidate has used a triangle of forces and the cosine rule to determine the net downward. As it happens, the F in this calculation is the weight of the dolphin. However, it is numerically equal to the total upward vertical force. This concise and perfect alternative technique picked up the maximum marks.
		ii	$68 = m \times 9.81$ $m = 6.9 \text{ (kg)}$	Possible ECF from (c)(i) Allow $68 = mg$ Note answer to 3 SF is 6.93 (kg) Allow $g = 9.8$; this gives 6.94 (kg) Not $g = 10$; this gives 6.8 (kg). Only the first C1 mark can be scored Examiner's Comments Almost all candidates correctly used $W = mg$ to determine the mass of the dolphin. Full marks were frequently picked up because of error carried forward (ECF) from (c)(i). There were very few cases of $g = 10 \text{ m s}^{-2}$ being used; this was penalised because $g = 9.81 \text{ m s}^{-2}$ is given in the Data, Formulae and Relationship Booklet.
		ii i	$E = \frac{\text{stress}}{\text{strain}} \quad (\text{Any subject})$ (Tension and E increase by the same factor of 1.29) ratio = 1.0	Allow $E = \frac{\sigma}{\epsilon} \quad \text{or} \quad E = \frac{FL}{Ax} \quad (\text{Any subject})$ Allow 1 SF answer Allow 1:1 Examiner's Comments This question on the equation for Young modulus E was well-answered with most candidates picking up one or more marks. The extension x of a wire is given by the expression $x = \frac{FL}{EA}$, where F is the tension in the wire, L its length and A its cross-sectional area. In this question, the extension $x \propto \frac{F}{E}$. Since both F and E increase by the same factor of 1.29, this meant that the ratio is 1.00. The most frequent incorrect answers were 1.29 and 1.29^{-1} or 0.78. The majority of the candidates in the upper quartile picked up 2 marks. Exemplar 7

2.3 Nature of Quantities

				(iii) The cables A and B have the same length and cross-sectional area. The material of cable B has Young modulus $1.29E$, where E is the Young modulus of the material of cable A. Both cables obey Hooke's law. Calculate the ratio $\frac{\text{extension of cable B}}{\text{extension of cable A}}$ $\frac{FL}{Ax} = E$ $\frac{87.4}{1.2E} = \frac{68}{E}$ $1.29E = \frac{87.4}{x}$ $x = \frac{87.4}{1.2E}$ $E = \frac{68}{x}$ $x = \frac{68}{E}$ ratio = [2] This exemplar shows a response from a top-grade candidate. The solution is much more elaborate and the response of 0.996 is given to 3 significant figures. A perfect solution that earned this candidate 2 marks.
