

1. In the Young double-slit experiment, light passes through two narrow slits and a pattern of light is observed on a screen.

Which property of light is **not** demonstrated by this experiment?

- A diffraction
- B refraction
- C wave nature
- D superposition

Your answer

☐

[1]

2. In a Young double-slit experiment, electromagnetic radiation is incident on a double slit. The following results are obtained.

distance from slits to screen = 3.5 m

distance between slits = 1.5 mm

distance between central fringe and 6th order fringe = 9 mm

What is the wavelength of the radiation?

- A $6.4 \times 10^{-7} \text{ m}$
- B $3.9 \times 10^{-6} \text{ m}$
- C $6.4 \times 10^{-1} \text{ m}$
- D $2.3 \times 10^{-5} \text{ m}$

Your answer

☐

[1]

3. Two waves, of wavelength λ , undergo constructive interference.

What is a possible path difference between the two waves?

- A $\frac{\lambda}{4}$
- B $\frac{\lambda}{2}$
- C $\frac{3\lambda}{2}$
- D λ

Your answer

☐

[1]

4. The diagram shows a stationary wave on a string.

What is the phase difference between the points on the wave labelled **X** and **Y**?

- A 0
- B $\frac{\pi}{4}$
- C $\frac{\pi}{2}$
- D π

Your answer

[1]

5(a). The diagram shows two identical loudspeakers X and Y connected to a signal generator. The loudspeakers emit sound waves of the same amplitude and frequency which are in phase.

A microphone M is moved along a line from P_1 to P_3 and the signal recorded on an oscilloscope.

As the microphone is moved along the line P_1 to P_3 the oscilloscope shows maximum signal at P_1 , zero signal at P_2 and the next maximum signal at P_3 .

Explain these observations.

[2]

(b). The distance between the centres of X and Y is 70.0 cm, the distance D (as shown in the diagram) is 4.00 m and the distance from P_1 to P_2 is 1.25 m.

Use the two source interference formula to calculate the frequency of the sound waves. (Speed of sound = 340 m s^{-1})

frequency = Hz **[3]**

(c). Loudspeaker Y is replaced with a loudspeaker that produces sound waves of twice the original amplitude.
Describe how the signal observed on the oscilloscope varies as the microphone is moved along the line P_1 to P_3 .

..... **[2]**

(d).

i. Explain what is meant by the term *intensity*.

..... **[1]**

ii. Calculate the factor by which the intensity of the sound waves at P_1 in the previous question is larger than the intensity of the original sound waves at P_1 .

factor = **[3]**

6. Two spherical dippers, **D1** and **D2** oscillate on a ripple tank as shown in **Fig. 5.1**.

Fig. 5.1

Waves on the surface of the water are produced from each dipper. These waves are in phase with each other.
The water waves have a speed of 8.0 cm s^{-1} and a wavelength of 3.2 cm.

Fig. 5.2 shows the positions **D1** and **D2** of the two dippers in the ripple tank.

Fig. 5.2

P and **Q** are two points on the water.

- i. The distance between **P** and **D1** is 12.2 cm.
The distance between **P** and **D2** is 20.2 cm.

Explain whether constructive or destructive interference occurs at **P**.

[3]

- ii. The distance between **Q** and **D1** is 12.5 cm.
The distance between **Q** and **D2** is 19.7 cm.

Calculate the phase difference ϕ , in rad, between the waves arriving at point **Q** from **D1** and the waves arriving at **Q** from **D2**.

$\phi = \dots\dots\dots$ rad [3]

7. Sound waves in air are longitudinal waves consisting of compressions and rarefactions.

A student investigates sound waves. They set up the following apparatus.

The sound wave emitted from the loudspeaker at **B** travels to the reflecting sheet at **A** and is reflected. A stationary wave is formed between the loudspeaker and the sheet.

The student moves a microphone along the line **AB**. The microphone is connected to an oscilloscope. The oscilloscope shows the relative amplitude of the stationary wave at each point along the line. The student observes a series of nodes and antinodes.

- i. Explain how a stationary wave with nodes and antinodes is formed.

[3]

- ii. The student measures the amplitude of the stationary wave at a range of distances from the reflecting sheet **A**. Their results are shown below.

The amplitudes at the nodes are observed to be:

- not exactly equal to zero
- closer to zero at distances closer to the reflecting sheet.

Explain these observations.

[3]

- iii. The student measures the distance between two adjacent nodes as 0.84 m.

The frequency of the sound wave is 200 Hz.

Use these measurements to calculate a value for the speed of sound waves in air.

speed of sound waves = m s⁻¹ [2]

- iv. The student wants to reduce the uncertainty in their calculated value for the speed of sound waves in air.

Suggest a suitable improvement to the student's method.

[1]

8. The picture shows an electron diffraction pattern produced by graphite in a cathode-ray tube.

Explain why light and dark circles as shown in the picture are produced, stating what this evidence provides about electron behaviour.

[3]

9(a). Fig.1 shows the pattern obtained in a Young double-slit experiment. The pattern is **not** to scale. Three regions of the pattern are labelled **A**, **B** and **D**. The central maximum is labelled **C**.

Fig. 1

Red light of wavelength 640 nm was used in the experiment. The distance between the centres of the two slits was $1.00 \times 10^{-5} \text{ m}$. The distance from the double-slit to the screen was 4.0 m .

Fig. 2

Explain how the part of the pattern labelled **B** is formed.

.....

.....

..... [2]

(b). Calculate the angle θ from the central maximum **C** to the maximum labelled **B** as shown in **Fig. 2**.

$$\theta = \dots\dots\dots^\circ \text{ [3]}$$

(c). Name the physical processes that cause the features labelled **A**, **D** and **B**, **C** in **Fig. 1**.

A and D

B and C

[2]

(d). The Young double-slit experiment uses **coherent** waves. State what **coherent** means.

[1]

10. A student experiments with microwaves emitted from a transmitter. The frequency f of the microwaves from the transmitter can be adjusted.

The student connects two microwave transmitters **X** and **Y**, and places them in front of a microwave detector **D**, as shown in the diagram below.

The transmitters **X** and **Y** produce **coherent** vertically polarised microwaves with the same frequency f .

The detector **D** is sensitive to vertically polarised microwaves only.

When the detector **D** is moved along the line **PQ**, a pattern of maximum and minimum intensity is observed. Adjacent maxima are separated by a distance x .

i. *Explain:

- why this pattern of intensity occurs
- the expected relationship between the frequency f and the distance x
- how to verify this relationship experimentally.

ii. Transmitter **X** is rotated about the line **AB** and the experiment is repeated at different orientations until it has been rotated by 180° .

[illegible]

11.

www.Educate-UK.net

The bright fringes are seen at points **M**, **O** and **Q**. The dark fringes are seen at points **N** and **P**.

State the phase difference ϕ in degrees, and the path difference d in terms of wavelength λ , for the waves from the two slits meeting at point **P**.

$$\phi = \dots\dots\dots^\circ \text{ [1]}$$

$$d = \dots\dots\dots \lambda \text{ [1]}$$

12. A student is carrying out the Young double-slit experiment using visible light. The distance between the slits and the screen is kept constant.

The wavelength of light is λ and the separation of the slits is a .

The following results are collected by the student.

	λ/nm	a/mm
A	450	0.20
B	510	0.15
C	550	0.25
D	610	0.30

Which combination of λ and a will give the **largest** separation between the adjacent bright fringes?

Your answer

[1]

13. Two coherent waves are emitted from the sources **X** and **Y**.

The diagram is not to scale.

The waves at **X** and **Y** are in phase.

The waves have wavelength 4.0 cm.

The phase difference of the two waves meeting at point **P** is 270° .

Which row gives possible distances for a and b ?

	a/cm	b/cm
A	20.0	26.0
B	20.0	22.0
C	15.0	18.0
D	10.0	14.0

Your answer

[1]

The diagram shows the path of microwaves travelling directly from **T** to **D** and the path of microwaves from **T** reflected from **R** to **D**. There is a 180° phase change when microwaves are reflected at **R**.

The metal sheet is moved away from the line joining **T** and **D** so that y increases. The metal sheet remains parallel to the line from **T** and **D**. A series of maximum and minimum intensities are observed.

The table shows the values of y for successive maximum and minimum intensities.

Intensity	<i>y / cm</i>
maximum	8.4
minimum	11.9
maximum	14.6
minimum	17.0

Explain the presence of the regions of maximum and minimum intensities **and** determine the wavelength of the microwaves.

This image shows a blank sheet of white paper with horizontal ruling lines. The lines are evenly spaced and extend across the width of the page. There are no margins, text, or other markings on the paper.
