

Mark scheme – Thermal Physics

Question			Answer/Indicative content	Marks	Guidance
1			C	1	Examiner's Comments As a substance melts, the PE of the molecules increases, ruling out answers B and D. The temperature of a melting substance does not change and so the KE of the molecules cannot change, as the temperature and mean KE of molecules are directly proportional. This means that C must be correct. A cannot be correct since the internal energy is the sum of the KE and PE of the molecules. The KE is constant and the PE increases, meaning the internal energy must also increase.
			Total	1	
2			A	1	
			Total	1	
3			The energy required per unit mass to change the temperature by 1 K / 1°C.	B1	Allow: $c = E/m \Delta\theta$, where E = energy, m = mass and $\Delta\theta$ = change in temperature.
			Total	1	
4			The sum of (the random distribution of) the KE and PE of (its) molecules	B1	Not if no clear indication of particulate nature, i.e. allow particles or atoms for molecules Examiner's Comments The correct answer for this item was a direct reference to specification point 5.1.2 (d) and required the association with the particles of a system. Many more than half of the candidates would have scored this mark had they included this association.
			Total	1	
5	a		$pV/T = \text{constant}$ $(1.0 \times 10^5 \text{ V})/290 = (1.0 \times 10^3 \times 1.0 \times 10^6)/230$ $V = 1.26 \times 10^4 \text{ (m}^3\text{)}$	B1 B1 B1	
	b	i	$n = pV/RT = 1.0 \times 10^5 \times 1.26 \times 10^4 / (8.31 \times 290)$ $n = 5.2 \times 10^5$	B1 B1	ecf allow 5.4×10^5 using 1.3×10^4
		ii	$4.0 \times 10^{-3} \times 5.2 \times 10^5 = 2.1 \times 10^3 \text{ (kg)}$	B1	ecf (i)
	c		(internal energy $\propto T$) $E = 1900 \times 230/290 = 1500 \text{ (MJ)}$	B1	
	d		$U = pVg = 1.3 \times 1.26 \times 10^4 \times 9.81 = 1.61 \times 10^5$	C1	or $1.3 \times 1.3 \times 10^4 \times 9.81 =$

5.1 Thermal Physics

					In this question, candidates should consider the equation $pV = nRT$. If the pressure and volume remain the same, this gives nT as a constant also. If the number of particles decreases to two thirds of the original number, then the temperature in kelvin, and thus the total kinetic energy and hence mean square speed must have increased by a factor of 1.5, giving option C. This question provided opportunities for middle-grade candidates.

1 9			$E = mc\Delta\theta$ (any subject) <u>and</u> gradient is larger for CD The specific heat capacity of the liquid is less than that of the solid.	M1 A1	ORA Allow: $\Delta\theta$ is larger for liquid in the same time interval or same energy supplied for "gradient" Allow $c \propto \text{gradient}^{-1}$ Not: $c = 1 / \text{gradient}$ <u>Examiner's Comments</u> Many candidates realised that the gradients of the lines AB and CD were related to the specific heat capacities of the solid and liquid states. Higher level responses included the formula relating energy change, mass, specific heat capacity and the temperature change, and how that formula related to the gradient of the line on a temperature-time graph. Once that link was established, the lower gradient indicates a larger specific heat capacity.

5.1 Thermal Physics

2 6	a	$pV = \text{constant}$ (or $p_1V_1 = p_2V_2$) $p_{\text{final}} = 2.4 \times 10^5 \times 1.2/1.5$ $= 1.9(2) \times 10^5 \text{ (Pa)}$	C1 C1 A1	<u>Alternative method:</u> $p = nRT/V$ (p must be the subject) Allow use of $p = NkT/V$ (with $N = 7.2 \times 10^{22}$ and $k = 1.38 \times 10^{-23}$) Substitute $p = 0.12 \times 8.31 \times 290 / 1.5 \times 10^{-3}$ ECF from 1a for incorrect n and/or T $p = 1.9(3) \times 10^5 \text{ (Pa)}$ <u>Examiner's Comments</u> Questions 1(a) and 1(b) took the ideal gas equation and applied it to an unfamiliar situation, that of a toy rocket. Most candidates answered these questions well, remembering to convert the temperature from 17°C to 290K.
	b i	$\Delta p = (2.4 - 1.0) \times 10^5 = 1.4 \times 10^5 \text{ (Pa)}$ upwards force ($= \Delta pA$) = $(2.4 - 1.0) \times 10^5 \times 1.1 \times 10^{-4}$ $= 15 \text{ (N)}$	C1 C1 A0	<u>Alternative method:</u> Downwards force (from trapped air) = $pA = 2.4 \times 10^5 \times 1.1 \times 10^{-4} = 26.4 \text{ (N)}$ and upwards force (from atmosphere) = $pA = 1.0 \times 10^5 \times 1.1 \times 10^{-4} = 11.0 \text{ (N)}$ So total upwards force = $26.4 - 11.0$ $= 15.4 \text{ (N)}$ Ignore any attempt to calculate weight Special case: Allow 1/2 for the use of $\Delta p = 2.4 \times 10^5 \text{ (Pa)}$ giving upwards force = 26.4 (N) <u>Examiner's Comments</u> Most candidates realised that a difference in air pressure between the inside and outside of the bottle would force the water downwards, producing an upwards force on the bottle which could be calculated using $p = F/A$.
	ii	$m = 0.3 + 0.05 (= 0.35) \text{ (kg)}$ (Resultant force = upwards force – $W = ma$) $15.4 - (0.35 \times 9.81) = 0.35a$ or $a = 12/0.35$ $a = 34 \text{ (m s}^{-2}\text{)}$	C1 C1 A1	$0.050 + (10^3 \times 0.3 \times 10^{-3})$ <u>Alternative approach:</u> $a = (15.4/m) - g$ ECF for incorrect value of m No ECF ci (since we are told that upwards force = $15(.4)(\text{N})$) Upwards force = 15 (N) gives $a = 33 \text{ (m s}^{-2}\text{)}$ <u>Examiner's Comments</u> This question, although a simple $F = ma$ problem, challenged many candidates. Exemplar 1 (ii) Hence calculate the initial vertical acceleration of the rocket. $p = \frac{F}{A} = \dots$ $m = pV = 1 \times 10^3 \times 0.3 \times 10^{-3} = 0.3$ $F = Ma$ $a = \frac{F}{M} = \frac{15.4}{0.3+0.05} = 44 \text{ ms}^{-2}$ Initial acceleration = <u>44</u> ms⁻² [3] Exemplar 1 shows the most common incorrect response. The correct value for mass ($m = 0.35\text{kg}$) has been used, but the value for the upwards force (15.4N) rather than the resultant force ($15.4 - mg$) has been used for F.

			Total	8	
2 8	a		There is no contact force between the astronaut and the (floor of the) space station (so no method of measuring / experiencing weight)	B1	Allow astronaut and the space station have same acceleration (towards Earth) / floor is falling (beneath astronaut) Examiner's Comments ? Misconception Experiencing weightlessness is not the same as being in freefall There was a lack of understanding of the nature of feeling weightless. The sensation of 'weightlessness' is a lack of the physiological sensation of 'weight'. The skeletal and muscular systems are no longer in a state of stress. This sensation is caused by a lack of contact forces as a result of the ISS and the astronaut experiencing the same acceleration. Common incorrect responses included: • the astronaut is weightless because he is falling • there is no resultant force on the astronaut • gravity is too weak to have any effect on the astronaut

5.1 Thermal Physics

					the ISS orbits in a vacuum where there is no gravity.
		b i	$M = 5.97 \times 10^{24}(\text{kg})$ or ISS orbital radius $R = 6.78 \times 10^6(\text{m})$ or $g \propto 1/r^2$ $(gr^2 = \text{constant so}) g \times (6.78 \times 10^6)^2 = 9.81 \times (6.37 \times 10^6)^2$ $g = 8.66 (\text{N kg}^{-1})$	C1 C1 A1	or $g (= GM/R^2) = 6.67 \times 10^{-11} \times 5.97 \times 10^{24} / (6.78 \times 10^6)^2$ Allow rounding of final answer to 2 SF i.e. 8.7 (N kg⁻¹) Examiner's Comments The simplest method here was to use the fact that g is inversely proportional to r^2, so $gr^2 = \text{constant}$. If this was not used, a value for the mass of the Sun had to be calculated, which introduced a further step. Candidates who omitted this calculation and used a memorised value of the Sun's mass instead were unable to gain full marks, because they invariably knew it to 1 s.f. only, whereas 3 were required. Errors occurred when candidates used the incorrect distance in the formula for g. Common errors included: - forgetting to square the radius - using the Earth's radius rather than the orbital radius of the satellite - calculating $(6.37 \times 10^6 + 4.1 \times 10^5)$ incorrectly.
		ii	$2\pi r/T = v$ or $T = 2 \times 3.14 \times 6.78 \times 10^6 / 7.7 \times 10^3$ $T = 5.5 \times 10^3 \text{ s} (= 92 \text{ min})$	M1 A1	ECF incorrect value of R from b(i)
		c	$\frac{1}{2}Mc^2$ $(\frac{1}{2}N_A mc^2) = \frac{3}{2}RT$ $=$ $c^2 = 3 \times 8.31 \times 293 / 2.9 \times 10^{-2} = 2.52 \times 10^5$ $\sqrt{c^2} = 500 (\text{m s}^{-1})$ $(= 7.7 \times 10^3 / 15)$	C1 C1 A1 A0	or $\frac{1}{2}mc^2 = \frac{3}{2}kT$ or $c^2 = 3kT/m$ or $c^2 = 3 \times 1.38 \times 10^{-23} \times 6.02 \times 10^{23} \times 293 / 2.9 \times 10^{-2} = 2.52 \times 10^5$ not $(7.7 \times 10^3 / 15) = 510 (\text{m s}^{-1})$ Examiner's Comments The success in this question depended on understanding the meaning of the term m in the formula $\frac{1}{2}mc^2 = \frac{3}{2}kT$ given in the Data, Formulae and Relationship booklet. A significant number of candidates took m to be the mass of one mole (the molar mass, M) whereas m is actually the mass of one molecule. Candidates who used the formula $\frac{1}{2}Mc^2 = \frac{3}{2}RT$ were usually more successful because the molar mass had been given in the question stem.
		d	power reaching cells ($= IA$) = $1.4 \times 10^3 \times 2500 = 3.5 \times 10^6 \text{ W}$ power absorbed = $0.07 \times 3.5 \times 10^6 = 2.45 \times 10^5 \text{ W}$ cells in Sun for $(92 - 35 =) 57 \text{ minutes}$	C1 C1 C1 A1	mark given for multiplication by 0.07 at any stage of calculation $(90 - 35 =) 55 \text{ minutes}$ using $T = 90 \text{ minutes}$ ECF value of T from b(ii) $55/90 \times 2.45 \times 10^5 = 1.5 \times 10^5 (\text{W})$ using $T = 90 \text{ minutes}$

5.1 Thermal Physics

			average power = $57/92 \times 2.45 \times 10^5 = 1.5 \times 10^5$ (W)		Examiner's Comments Although this question looked daunting, it was actually quite linear and many candidates who attempted it were able to gain two or three marks even if they did not eventually get to the correct response. Candidates who set out their reasoning and working clearly were more liable to gain these compensatory marks.
			Total	13	
29			$P = (m/t)c\theta = 0.070 \times 4200 \times (30 - 14)$	C1

30			Energy used to heat water to 100 °C = $0.60 \times 4200 \times 80$ (= 201.6 kJ)	C1	Possible ecf from (a)
			Energy remaining to vaporise water = 528 (kJ) – 201.6 (kJ) (= 326.4 (kJ))	C1	
			mass vaporised = $326.4 \times 10^3 / 2.3 \times 10^6$ = 0.1419 (kg)	C1	Examiner's Comments This was a challenging multi-step calculation that differentiated between the candidates well.
			mass of water left = 0.60 – 0.1419	A1	A method employed by many high-scoring candidates began with a word equation "Total energy transferred = energy required to heat water to boiling point + energy required to vaporize water". This made it clear to award the mark for substituting into the specific heat capacity equation and clear to the candidate how to find the mass of vaporized water.
			mass of water left = 0.46 (kg)		A minority of candidates forgot to subtract the mass of vaporized water from the initial mass.
			Total	4	
31		i	$(pV = nRT)$ $100 \times 10^3 \times (0.46)^3 = n \times 8.31 \times (273 + 20)$ $n = 4.0$	C1 A1	Note $T = 20$ is XP Not 1 SF answer of 4 Note answer is 4.00 to 3SF
		ii		C1	Note $T = 1300$ is XP

5.1 Thermal Physics

			$\frac{100}{293} = \frac{p}{1573} \text{ or } p \times (0.46)^3 = n \times 8.31 \times 1573$ pressure = 540 (kPa)	A1	Allow use of correct, unrounded n
			Total	4	
3 2			No change in KE because temperature is constant (during melting) PE of (the molecules) increases (during melting) The internal energy increases	M1 A1 M1 A1	Allow 'KE is not changing' Not 'KE is not increasing' Note: This A1 mark can only be scored if both M1 marks have been awarded. Examiner's Comments This question was designed to lead the candidates into thinking about both KE and PE of the particles contained within the paraffin. The stem of the question includes a reference to constant temperature, so credit could only be awarded to linking this idea to that of the molecules' constant average KE, since average KE is directly proportional to absolute temperature. KE not changing was an acceptable alternative wording to constant average KE, but 'KE not increasing' was not. Candidates often picked up a mark for correctly stating that the PE of the molecules increased but would only gain the final mark for stating that the internal energy increased if they had already got the correct ideas for both PE and KE. Examiners commented that some candidates assumed conservation of energy and so if PE went up then KE went down or vice versa. Candidates wasted time and effort by describing what happened either before or after melting, which was not required.
			Total	4

3 4	a		Use a thermometer (with ± 1 °C) Stir water bath / avoid parallax (for glass thermometer)	B1 B1 Examiner's Comments A large majority included a correct measuring device, such as a thermometer. Significantly fewer described a technique for accurate measurements such as stirring the water or taking the temperature at several points and calculating a mean temperature.	Allow 'temperature sensor / gauge' Allow 'avoid touching sides of water bath with thermometer' Allow 'take temperature in several places / times and average' Allow idea of 'leave thermometer for long time (to reach thermal equilibrium)' Not idea of 'use thermometer with finer resolution'
	b	i	Smaller (spacing between) divisions / increments (AW)	B1 Examiner's Comments Approximately half of the candidature made a correct comment regarding resolution or that the smaller intervals on the psi scale made it a sensible choice of scale.	Ignore any reference to accuracy or precision Allow 'less uncertainty' Allow better or smaller or greater or higher resolution
		ii	$p = 37.0 \times 4.448 / (1000 \times 0.0254^2)$ 255 (kPa) uncertainty = 3 (kPa)	B1 B1 Examiner's Comments The vast majority of candidates correctly calculated the pressure in kPa and	Allow clearly identified correct answer in table or in working area. Must be 3sf Must be 1sf Allow 255.1 ± 3.4 scores mark 1

5.1 Thermal Physics

				stated that the absolute uncertainty was 3 kPa. A very small number of responses were rounded inappropriately.
	c	i	Point plotted at (44, 255)	B1 ECF from (b)(ii) Plot to with $\pm$ half a small square Ignore checking error bars Examiner's Comments Most candidates correctly plotted the point with error bars. In this instance during marking Examiners were instructed to ignore the error bars as they were too difficult to view when scanned.
		ii	Level 3 (5–6 marks) Clear explanation, description and determination <i>There is a well-developed line of reasoning which is clear and logically structured.</i> <i>The information presented is relevant and substantiated.</i> Level 2 (3–4 marks) Some explanation, description and determination Or Some explanation and clear determination <i>There is a line of reasoning presented with some structure. The information presented is in the most part relevant and supported by some evidence.</i> Level 1 (1–2 marks) Limited explanation or description or determination <i>The information is basic and communicated in an unstructured way.</i> <i>The information is supported by limited evidence and the relationship to the evidence may not be clear.</i> 0 marks No response or no response worthy of credit.	B1 $\times$ 6 Indicative scientific points may include: Explanation and Description - Absolute zero is the minimum possible temperature / at absolute zero KE is zero - At absolute zero p is zero - At absolute zero, the internal energy is minimum (allow 0) - Absolute zero should be (about) $-273\text{ }^{\circ}\text{C}$ - Reference to $pV = nRT$ or $pV = NkT$ or $p \propto T$ - A graph of p against θ is a straight line / straight line drawn on graph - Intercept of straight line with x-axis or θ-axis is absolute zero calculated by using $y = mx + c$ Determination - Gradient in the range 0.7 to 0.9 (kPa K^{-1}) $y = mx + c$ used to determine the intercept c or absolute zero - Absolute zero in the range $-320\text{ }^{\circ}\text{C}$ to $-240\text{ }^{\circ}\text{C}$ Use only L1, L2 and L3 in RM Assessor. Examiner's Comments It was clear that the majority of candidates had either performed this experiment themselves or had otherwise seen it before. The concept of absolute zero was very successfully described and many knew that an extrapolation or calculation involving the equation of a straight line was required to find absolute zero as the x-intercept of the straight line. Common errors included mis-calculating the gradient, inability to rearrange the

5.1 Thermal Physics

				equation or inappropriate conversion to kelvin. Re-plotting the graph was not required and merely wasted time for little reward.
	d	Draw the worst fit line (through all the error bars) (AW). Determine the new value for absolute zero and find the difference between the value in (c)(ii) and this new intercept. (AW)	B1 B1	Examiner's Comments Many candidates realised that drawing a line of worst fit was sensible. Far fewer were clear that using the line of worst fit to find a new x-intercept, leading to a spread in values for absolute zero was the correct procedure. Many incorrectly suggested finding the difference in gradients, or percentage differences in gradients.
	e	Cooling gas value of absolute zero is lower than (c)(ii) (Whilst cooling, the) temperature of gas lags behind the temperature of water (AW, ORA) Graph is shifted to the left Stir water / <u>wait</u> for temperatures to be the same / attempt at measuring temperature of gas directly (AW)	B1 B1 B1 B1	Allow: gradient is too shallow Allow: p measured is higher than expected for incorrect measurement of T (so affects the graph) (AW, ORA) Not insulation of water bath Not heat losses Examiner's Comments The first mark for this item was intended to be for a straightforward comparison that the repeated experiment yielded a lower value than that from part c(ii). Many candidates calculated a percentage difference yet did not refer to the direction of difference. Some candidates successfully suggested that the water would always be cooler than the gas and so the thermometer reading would be systematically lower than the true temperature of the gas. Rather fewer discussed that the pressure reading would therefore be higher than it should be for the thermometer reading. Very few candidates linked this idea to the effect on the graph, namely that the points would all be shifted to the left, causing a lower x-intercept or a less steep line of best fit. There were three acceptable experimental approaches to avoid this systematic error. Stirring the water and waiting until the gas and water equilibrated would have reduced the effects of the rapid cooling. A sensible approach employed by some candidates was to take the temperature of the gas directly using a thermometer or temperature inside the flask.

The information presented is relevant and substantiated.</i> Level 2 (3–4 marks) Clear description OR Clear calculations of energy per kg OR Some description and some calculations <i>There is a line of reasoning presented with some structure. The information presented is in the most-part relevant and supported by some evidence.</i> Level 1 (1–2 marks) Limited description OR Limited calculations <i>There is an attempt at a logical structure with a line of reasoning. The information is in the most part relevant.</i> 0 marks No response or no response worthy of credit		• More energy produced (per reaction) in fission • The (total) binding energy of 'products' is greater • In fusion, nuclei repel (each other) • Fusion requires high temperatures / high KE • Fission reactions are triggered by (slow-)neutrons • Chain reaction possible in fission Calculations • 1 kg of uranium has 4.26 mols / 2.56×10^{24} nuclei • 1 kg of deuterium has 500 mol / 3.01×10^{26} nuclei / 1.50×10^{26} 'reactions' • $200 \text{ MeV} = 3.2 \times 10^{-11} \text{ J}$ • $4 \text{ MeV} = 6.4 \times 10^{-13} \text{ J}$ • Uranium: $\sim 10^{14} \text{ (J kg}^{-1}\text{)}$ (actual value 8.2×10^{13}) • Deuterium: $\sim 10^{14} \text{ (J kg}^{-1}\text{)}$ (actual value 9.6×10^{13}) • The energy per kg is roughly the same <u>Examiner's Comments</u> This is the second LoR question. This is designed to assess knowledge of the two nuclear energy reactions and to calculate energy release using some given data. The differences between the fission and fusion reactions were generally well answered although many candidates explained differences in design, operation and waste more than the reactions. The similarities were often not as clear however several candidates gave excellent responses in terms of binding energies and mass differences. Candidates were also expected to complete a calculation to show which produces more energy output per kilogram. This is challenging calculation to follow through fully, but most candidates were able to make some attempt, even if it was only converting MeV to J. Only better candidates realised 2 nuclei of deuterium were used for one fusion reaction. While a small number of candidates did correctly calculate the energy per kilogram, they tended to state that fusion produced more energy rather than a feeling that they are basically equivalent. As usual with LoR questions, a holistic approach is taken to the marking and candidates can access higher levels without necessarily reaching all the marking points. Even so, relatively few candidates were able to access Level 3, generally due to poor calculations and/or descriptions.

3 9		Level 3 (5 – 6 marks) Clear expansion of three statements <i>There is a well-developed line of reasoning which is clear and logically structured. The information presented is clear, relevant and substantiated.</i> Level 2 (3 – 4 marks) Clear expansion of two statements or Limited attempt at all three <i>There is a line of reasoning presented with some structure. The information presented is in the most part relevant and supported by some evidence.</i> Level 1 (1 – 2 marks) Limited attempt at one or two statements <i>There is an attempt at a logical structure with a line of reasoning. The information is in the most part relevant.</i> 0 marks <i>No response or no response worthy of credit.</i>	B1 x 6	Use level of response annotations in RM Assessor, e.g. L2 for 4 marks, L2⁺ for 3 marks, etc. Indicative scientific points may include: statement 1 • fusion reactions are occurring • which change H into He • and mass is lost which releases energy • energy released = $c^2\Delta m$ • Δm per second = luminosity / c^2 statement 2 • average k.e. of each proton is $\frac{3}{2}kT$ • high T means protons are travelling at high speed • so fast enough to overcome repulsive forces • and get close enough to fuse • p.e. = $e^2/4\pi\epsilon_0 r$ so T must be high enough for $\frac{3}{2}kT > e^2/4\pi\epsilon_0 r$ • r is approximately 3fm statement 3 • k.e. $\propto T$ so average energy at 10^7 K is only one thousandth of the average energy at 10^{10} K when protons might fuse • but M-B distribution applies so at the high energy end there will be a few p with enough energy • quantum tunnelling across potential barrier is possible • small probability of many favourable collisions to boost energy of p • 4 p must fuse to produce He; it is complicated process making probability of fusion much less • number of p in Sun is so huge that, even with such a small probability, 4×10^9 kg of p still interact s^{-1} • a larger probability means lifetime of the Sun would be shorter <u>Examiner's Comments</u> This was one of the two LoR questions. It required understanding of fusion, mass-energy equivalence, the Maxwell-Boltzmann distribution, and the relationship between mean kinetic energy and temperature for particles in an ideal gas. Responses to the following questions were being sought: 1. Why is the Sun losing mass? 2. Why is an extremely high temperature needed for fusion in stars? 3. Why does fusion occur in the Sun even though its temperature is 1,000 times less than that required by theory? Two dissimilar responses could score comparable marks if the criteria set out in the answer section of the marking scheme were met. Level 3 responses gave a clear answer to all three of the questions, whereas Level 2 responses generally
--------	--	---	-----------	--

5.1 Thermal Physics

				Examiner's Comments The key to this question is equating 2 formulae. The first is the familiar $\frac{1}{2} m v^2$ for kinetic energy. In this case, the squared speed will be the mean squared speed of the particles. The second is the connection between average kinetic energy of a particle at absolute temperature, T, $E_k = \frac{3}{2} k T$. If candidates did that, then they not only scored the first mark but also could go on to complete the question. A common error was to forget to find the square root, as the question asks for the root mean square speed.
		ii	(number of molecules =) $1.3 \times 6.02 \times 10^{23}$ or 7.83×10^{23} mean KE = $\frac{3}{2} \times 1.38 \times 10^{-23} \times 523$ or 1.08×10^{-20} total kinetic energy = 8.5×10^3 (J)	Not 250°C Allow 8.4×10^3 for use of 670 m s^{-1} Allow full credit for use of total KE = $1.5nRT$ Allow full credit for use of E_k for one molecule = $\frac{1}{2} m c_{\text{RMS}}^2$ (which may include ECF for their c_{RMS} in (d)(i)) Allow 2 marks for $4.0(5\dots) \times 10^3$ (J) ; no conversion to kelvin. Examiner's Comments There were 2 ways to answer this question. The first was to find the kinetic of one particle using the mean square speed and the second was to find the kinetic energy of one particle using the absolute temperature. Lower level responses stopped at that point, or there was misunderstanding how to scale that value up to the whole gas. For either route, the value for one particle needed to be multiplied by the number of particles in the gas. This can be found by multiplying the number of moles by the Avagadro constant given in the data, formulae and relationship booklet.
		Total	6	
4 2		i	KE = $\frac{1}{2}mv^2$ and GPE = GMm / r $\frac{1}{2}mv^2 = GMm / r$ then a valid step to $v = \sqrt{(2GM / r)}$	Allow $m = 1$ (kg) if clearly defined Examiner's Comments Examiners were delighted that candidates proved the relationship for escape velocity very clearly indeed with the higher ability candidates correctly suggesting that 'KE + GPE = 0' was the condition for escape, although 'KE lost = GPE gained' would have been a clear way of reconciling any minus sign confusion. A minority of candidates tried, unsuccessfully, to invoke the expression for circular motion inappropriately.

5.1 Thermal Physics

		ii	$(v^2 = 2 \times 6.67 \times 10^{-11} \times 0.131 \times 10^{23} / 1.19 \times 10^6)$ $v = 1200 \text{ (m s}^{-1}\text{)}$	A1	Answer to 3.s.f. is 1210 Examiner's Comments Approximately four-fifths of all candidates calculated the escape velocity on Pluto correctly. Those that did not score the mark for this item did so because of improper calculator use or, more rarely, because they selected the wrong data from the question.
		ii i	Mercury has a higher escape velocity than Pluto (ORA) Mercury is closer to sun and Mercury is <u>hotter</u> (ORA) Molecules on Mercury (are more likely to) have speed higher than the escape velocity	B1 M1 A1	Allow a supporting calculation (speed is about 4.2 km s^{-1}) Allow 'required speed' for 'escape velocity' Allow 'fast enough to escape' Examiner's Comments Candidates found this last item very challenging indeed, with only exceptional candidates gaining two or three marks. Many candidates suggested that the reason for Mercury's lack of atmosphere was the superior gravitational pull of the Sun, which is wholly incorrect. Others suggested that the solar wind or 'radiation' had burnt off the atmosphere. Rather fewer candidates correctly related Mercury's smaller mean distance to the Sun and its higher temperature or reasoned that Mercury's escape velocity was higher than Pluto's. Only a small minority of candidates recognised that even though Mercury has a higher escape velocity, its higher temperature gave the atmosphere's molecules a higher average speed which would have exceeded Mercury's escape velocity.

Examiner's Comments

Exemplar 6

$$\frac{1}{2} m \bar{c}^2 = \frac{3}{2} kT$$

$$\bar{c}^2 = \frac{3kT}{m} = \frac{3 \times 1.38 \times 10^{-23} \times 283}{4.0026 \times 10^{-26}}$$

$$= \frac{3 \times 1.38 \times 10^{-23} \times 283}{4.0026 \times 10^{-26}}$$

$$= 6.64 \times 10^27$$

$$\bar{c}^2 = 176448798$$

$$\bar{c} = 132834$$

$$\approx 1330 \text{ m s}^{-1}$$

Particles move around randomly with random speeds. Collisions are elastic so KE is not lost. Most particles are moving at speeds around 1330 m s^{-1} a little less but given the random motion of particles, which follow Boltzmann's distribution, a very little of these have speeds $\geq 11 \text{ km s}^{-1}$. Eventually all ^{molecules} particles should escape Earth's atmosphere ^{helium} but since helium nuclei are just alpha particles ^{which} are produced in ~~radioactive~~ radioactive reactions, these are constantly being produced. Hence, we

can still find small amounts of ^{helium} today on Earth.

In correctly calculating the root means square speed and by being clear about how that has been calculated, this candidate has gained L2 already. There is a correct comparison of this speed with the escape velocity. There is also reference to the Boltzmann distribution of speeds, suggesting that even though a small fraction will have a sufficient velocity, over time those particles will escape.

Most candidates made good progress with the calculation or provided

5.1 Thermal Physics

					an alternative by calculating the mean KE of a particle and comparing that with the KE a particle with escape velocity would have. A significant fraction made a poor comparison of their value with escape velocity (e.g. that 1300 ms^{-1} was greater than 11 km s^{-1}) or compared the mean squared speed with the escape velocity.

4 8		i	sin or cos wave with 1.5 wavelengths (between C and R) y-axis showing scale, i.e. (amplitude) $2.0 \times 10^{-6} \text{ (m)}$ correct scale on x-axis showing $\lambda = 0.2 \text{ (m)}$ X and Y labelled at adjacent intercepts on x-axis	B1 B1 B1 B1	unit must be present, e.g 10^{-6} m NOT if axis labelled time Examiner's Comments Most candidates correctly labelled the scale on the displacement axis of the sinusoidal graph that they drew. The points where the air particles were moving the fastest were also well known. Fewer labelled <i>distance</i> on the x-axis, many incorrectly writing <i>time</i> . Only the better candidates marked the correct scale on this axis and very few indicated that there were 1.5 wavelengths between the points C and R .
		ii	$v = A\omega$ or $2\pi fA$ $v = (2 \times 10^{-6} \times 2 \times 3.14 \times 1.7 \times 10^3 =)$ $2.1 \times 10^{-2} \text{ (m s}^{-1}\text{.)}$ $\frac{1}{2}Mv^2 = \frac{3}{2}RT$ and $T = 290$ $2v = \sqrt{(3 \times 8.31 \times 290 / 0.029)}$ $v = 5(.0) \times 10^2 \text{ (m s}^{-1}\text{.)}$	C1 A1 C1 A1	or $\frac{1}{2}mv^2 = \frac{3}{2}kT$ so $v^2 = 3(k/m)290$ N.B. remember to record a mark out of 4 here Examiner's Comments Answers were generally well structured into two sections, one for each experiment. A few candidates thought they could measure the wavelength on the oscilloscope screen. In experiment (a) most understood that the phase difference between the two oscillations at the microphone changed as one speaker was moved away. Explanations often muddled <i>path</i> and <i>phase</i>

5.1 Thermal Physics

					difference or referred to <i>nodes</i> and <i>antinodes</i> detected by the microphone. Some candidates misinterpreted the experiment moving the microphone to detect interference fringes, allowing the double slits formula to be used to find the wavelength. Others thought that Doppler shift was applicable. For experiment (b) many candidates used <i>maxima</i> and <i>minima</i> in place of <i>antinodes</i> and <i>nodes</i> although most recognised this to be a <i>standing</i> wave situation. Quite a few candidates ignored the instruction about reducing the uncertainty. The best candidates suggested reducing the frequency to reduce the percentage uncertainty in the wavelength measurement.
